-History

History

Ethernet Powerlink was first introduced as a proprietary protocol by B&R in the early years of this millennium. To gain wider acceptance of the B&R protocol by the market an "independent" association Ethernet Powerlink Standardization Group (EPSG) was founded in June 2003. The focus of the group is to leverage the advantages of Ethernet for high performance Real-Time networking systems based on the Ethernet POWERLINK Real-Time protocol. Various working groups are focusing on different tasks like safety, technology, marketing, certification and end users. The EPSG is cooperating with standardization bodies and associationns. like the CAN in Automation (CiA) Group and the IEC.[5]

- Real time computing?

Real time computing

In computer science, real-time computing (RTC), or reactive computing, is the study of hardware and software systems that are subject to a "real-time constraint" i.e., operational deadlines from event to system response. Real-time programs must execute within strict constraints on response time. [1, page 164, chapter 16]

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

-Real time computing?

Why is TCP/IP over Ethernet not sufficent for (fast) real time systems?

The main reason lies within the architecture:

 On the physical link layer CSMA/CD (Carrier Sense Multiple Access/Collision Detection) does not prevent random jamming of time critical messages or commands.

After a station detects a collision, it aborts its transmission, waits a random period of time, and then tries again, assuming that no other station has started transmitting in the meantime. Therefore, our model for CSMA/CD will consist of alternating contention and transmission periods, with idle periods occurring when all stations are quiet (e.g., for lack of work).[3]

- The idea of a synchronous protocol.

The constraints to the RT-system

Let us think of a system that provides the following functionality.

- 240 Network devices in one network segment.
- Deterministic communication must be guaranteed.
- Less than 200µs cycle time.
- Based on the Ethernet framework.

In mathematics, a deterministic system is a system in which no randomness is involved in the development of future states of the system.[4] A deterministic model will thus always produce the same output from a given starting condition or initial state.[4]

- The idea of a synchronous protocol.

The problem with Ethernet IEEE 802.3 in half duplex mode.

The slot time of an 100MB Ethernet is $t_{slot} \approx 5\mu s$. It is twice the time it takes for an electronic pulse (OSI Layer 1 -Physical) to travel the length of the maximum theoretical distance between two nodes. In CSMA/CD networks such as ethernet, Network Interface Controllers (NICs) wait a minimum of the slot time (which should be a constant, NOT dependent on the individual network -ie, it is a standard across all CSMA/CD networks that use a common NIC) before transmitting, allowing time (the maximum theoretical time - slot time) for the pulse to reach the NIC that intends to send.[6]

- The idea of a synchronous protocol.

The problem with Ethernet IEEE 802.3 in half duplex mode, cont'd

Let us say that a time critical message via package p_m of station A must fight its way through the CSMA/CD network to station B. Imagine that in coincidence all 238 stations try to send to station B. Station A might not be able to send the package and receive the proper ACK from B for more than 476 times the slot time, as every other station awaits also an acknowledge package as each acknowledgement package itself must fight its way through the CSMA/CD network. **The odds on such bad timing are very poor, but it may happen.**

$$t_{pm} > stations * 2 * t_{slot} \approx 2.4 ms \gg 200 \mu$$
 (1)

And the 200µs cycle time must include all 240 stations (not only A)!

The idea of a synchronous protocol.

One ring to rule them all.

Possible Solutions?

Token Ring Network (Daisy Chain Ethernet?!?)

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

- The idea of a synchronous protocol.

One ring to rule them all.

Possible Solutions?

- Token Ring Network (Daisy Chain Ethernet?!?)
- Ethernet in FullDuplex mode (CSMA-CD deactivated, switched Network). One to many or many to one may result in the same timing problem as with CSMA-CD as the switch must queue and deliver(divert) all messages.

Modes of Operation.

The two modes.

The POWERLINK Ethernet standard defines to basic operational modes:

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ = 臣 = のへで

Power Link mode

- Modes of Operation.

The two modes.

The POWERLINK Ethernet standard defines to basic operational modes:

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

- Power Link mode
- Basic Ethernet mode (CSMA-CD, non deterministic)

- Modes of Operation.

Power Link mode.

- In POWERLINK Mode network traffic follows the set of rules given by standard for Real-time Ethernet communication ([2, EPSG 301]).
- POWERLINK Managing Node (MN) manages Network access.
- A Client Node (CN) can only be granted the right to send data on the network via the MN.
- The central access rules preclude collisions, the network is therefore deterministic in POWERLINK Mode.

In POWERLINK Mode most communication transactions are via POWERLINK-specific messages. An asynchronous slot is available for non-POWERLINK frames. UDP/IP is the preferred data exchange mechanism in the asynchronous slot; however, it is possible to use any protocol. [2, page 40, chapter 4.1]

- Modes of Operation.

The Basic Ethernet mode.

In Basic Ethernet Mode network communication follows the rules of Legacy Ethernet (IEEE802.3). Network access is via CSMA/CD. Collisions occur, and network traffic is non- deterministic. Any protocol on top of Ethernet may be used in Basic Ethernet mode, the preferred mechanisms for data exchange between nodes being UDP/IP and TCP/IP.[2, page 40, chapter 4.1]

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

The POWERLINK Cycle.

Isochrounous POWERLINK Cycle

Isochronous data exchange between nodes shall occur cyclically. It shall be repeated in a fixed interval, called POWERLINK cycle. Each cycle consists of several phases:

▲ロト ▲ □ ト ▲ □ ト ▲ □ ト ● ● の Q ()

The Isochrounous phase.

Isochrounous POWERLINK Cycle

Isochronous data exchange between nodes shall occur cyclically. It shall be repeated in a fixed interval, called POWERLINK cycle. Each cycle consists of several phases:

▲□▶▲□▶▲□▶▲□▶ □ のQで

- The Isochrounous phase.
- The asynchronous phase.
- The Idle phase.
- [2, page 42, chapter 4.2.1]

The POWERLINK Cycle.

Isochrounous POWERLINK Cycle

It is important to keep the start time of a POWERLINK cycle as exact (jitter-free) as possible. The length of individual phases can vary within the preset phase of a POWERLINK cycle.[2, page 42, chapter 4.1]

~ ~ ~ ~ ~

- The POWERLINK Cycle.

Frames (isochronous).

- SoC (Start of Cycle) is a mutlicast Ethernet frame generated on a periodc basis.
- PReq (Poll request, shall be sent to every configured and active NC. (unicast only).
- PRes (Poll response, The response of an accessed CN. (may be reviewed by all Nodes)

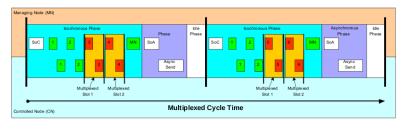

The PReq / PRes procedure shall be repeated for each configured and active isochronous CN. When all configured and active isochronous CNs have been processed, the MN may send a multicast PRes frame to all nodes. This frame is dedicated to transfer data relevant for groups of CNs. [2, page 42]

The POWERLINK Cycle.

Multiplexed Timeslots

POWERLINK supports CN communication classes, that determine the cycles in which nodes are to be addressed. This leeds us to the multiplexed cycle time and we do get two types of stations.

- Cyclic stations.
- Multiplexed stations.

Cyclic station Multiplexed station

1 - 6: PReg resp. PRes to/from CN 1 - 6

- The POWERLINK Cycle.

Frames (asynchronous).

In the asynchronous phase of the cycle, access to the POWERLINK network may be **granted to one** CN or to the MN for the transfer of a single asynchronous message **only**.

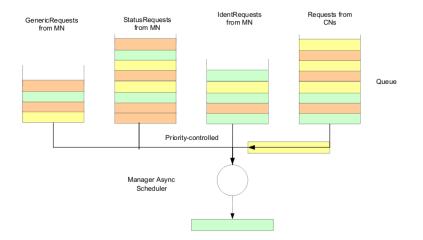

- SoA Start of asynchronous send.
- ASend Asynchronous send frame.

The asynchronous phase shall be calculated from the start of SoA to the end of the asynchronous response. If no asynchronous response is allowed for any node, the asynchronous phase shall be terminated by the end of SoA.[2, page 45, chapter 4.2.2.1.]

▲□▶▲□▶▲□▶▲□▶ □ のQで

The POWERLINK Cycle.

Asynchronous Scheduling.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

The POWERLINK Cycle.

Asynchronous Transmit Priorities.

Asynchronous transmit requests may be prioritized by 3 PR bits in the PRes, the IdentResponse and StatusResponse frame.[2, page 45, chapter 4.2.] POWERLINK supports eight priority levels. Two of these levels are dedicated to POWERLINK purpose:

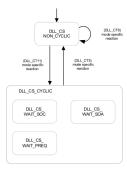

- PRIO_NMT_REQUEST, This is the highest priority that shall be exclusively applied if a CN requests an NMT command to be issued by the MN
- PRIO_GENERIC_REQUEST, Medium priority which is the standard priority level for non-NMT command requests.

[2, page 70]

The POWERLINK Addressing.

MAC addressing.

A POWERLINK node must support unicast, multicast and broadcast Ethernet MAC addressing in accordance with IEEE802.3.

- MAC Unicast The high order bit of the MAC is 0 (unicast address, should be globally unique.)
- MAC Multicast For group addresses the high-order bit of the MAC address is 1. Registered nodes to group address will receive it.

	MAC-Multicast address
Start of Cycle (SoC)	C_DLL_MULTICAST_SOC
PollResponse (PRes)	C_DLL_MULTICAST_PRES
Start of Asynchronous (SoA)	C_DLL_MULTICAST_SOA
AsynchronousSend (ASnd)	C_DLL_MULTICAST_ASND
Active Managing Node Indication (AMNI) used by EPSG DS302-A [1]	C_DLL_MULTICAST_AMNI

- The POWERLINK Addressing.

Integration with Ethernet.

- POWERLINK resides on top of 802.3 MAC layer.
- Messages are encapsulated in Ethernet II frames. (Ethernet type field = 88AB_h).
- The length of the frame shall be restricted to the configured size. Otherwise the cycle time could not be guaranteed. Ethernet frames shall not be shorter than the specified minimum of 64 octets.

MessageType	mtyp	POWERLINK message type identification	PRes
Destination	dest	POWERLINK Node ID of the addressed nodes	C_ADR_BROADCAST
Source	src	POWERLINK Node ID of the transmitting node	CN NodelD
NMTStatus	stat	Shall report the current status of the CN's NMT state machine	
Multiplexed Slot	MS	Flag: Shall be set in PRes frames from CNs that are served by a multiplexed timeslot. Based on this information, other CNs can identify that the transmitting CN is served by a multiplexed slot	
Exception New	EN	Flag: Error signaling, refer 6.5.2	
Ready	RD	Flag: Shall be set if the transferred payload data are valid. It shall be handled by the application process in the CN. All other CNs and the MN shall be allowed to accept data only if RD is set	
Priority	PR	Flags: Shall indicate the priority of the frame in the asynchronous send queue with the highest priority. (See 4.2.4.1.2.2)	C_DLL_ASND_PRIO_NMTRQST C_DLL_ASND_PRIO_STD
RequestToSen d	RS	Flags: Shall indicate the number of pending frames in asynchronous send queue on the node. The value C_DLL_MAX_RS shall indicate C_DLL_MAX_RS or more requests, 0 shall indicate no pending requests	0 - C_DLL_MAX_RS
PDOVersion	pdov	Shall indicate the version of the PDO encoding used by the payload data, refer 6.4.2	
Size	size	Shall indicate the number of payload data octets	0C_DLL_ISOCHR_MAX_PAYL
Payload	pl	Isochronous payload data sent from the node to the POWERLINK network. The lower layer shall be responsible for padding. Payload to be used by PDO, refer 6.3.4	

- The POWERLINK frames in detail.

Start of asynchronous (SoA) frame.

				Bit C	Offset			
Octet Offset 12	7	6	5	4	3	2	1	0

 - Collisions
 - POWERLINK address conflict.
 - Multiple Managing Nodes.
 - Timing Violation (late response).

- Error Handling in the data link layer (DLL).

Error handling.

There are of course a lot of strategies to deal with errors. On each node exists an error history where the occoured error symptoms are stored.

The symptoms are classified and do have a corrsponding error count. Errors detected on the MN are often to be seen more critical than some errors on the CNs. Such as Timing violations on MN's side wich are critical due to cycletime consistency compared to CRC errors of SoAs received by a CN. (Which than can be logged into CN error history and the frame beeing ignored). [2, page 81, chapter 4.7]

- Error Handling in the data link layer (DLL).

Error threshold counters. I

Every time an error symptom occurs the threshold counter shall be incremented by 8. After each cycle without reoccurance of the error the counter shall be decremented by one (Threshold counter 8:1). When the threshold value is reached (threshold counter threshold), it shall trigger an action and the threshold counter shall be reset to 0.

- Error Handling in the data link layer (DLL).

Error threshold counters. II

- All kinds of POWERLINK cycle,e.g. reduced and isochronous cycle, shall decrement threshold counters. Async-only and multiplexed nodes shall decrement at every cycle but not only to cycles adressing them.
- The threshold value shall be configurable.
- Immediate error reaction shall be commanded by a threshold value of 1.
- Threshold counting and error reaction may be deactivated by setting the threshold value to 0.
- Threshold counter handling shall be performed on a per error source basis.

A lot of error handling strategies are formulated but more details would break the mould.

- Network / Transport Layer

The IP Addressing

Internet Protocol

The IP (UDP and TCP) protocols are prefered for the asynchrounous phase.

- Each IP-capable POWERLINK node posseses an IPv4 address, subnet mask and default gateway.
- The private class C Net ID 192.168.100.0 shall be used for a POWERLINK network see RFC1918.

Each IP capable POWERLINK node shall have a hostname.

- Network / Transport Layer

- The IP Addressing

Internet Protocol

- ► A class C network provides 254(1 254) IP addresses, which matches the number of valid POWERLINK Node IDs.
- The Host ID of the private class C Net ID 192.168.100.0 shall be identical to the POWERLINK Node ID.
- The last byte of the IP address (Host ID) has the same value as the POWERLINK Node ID.
- The subnet mask of a POWERLINK node shall be 255.255.255.0 This is the subnet mask of a class C net.
- The Default Gateway preset shall use the IP address 192.168.100.254. The value may be modified to another valid IP address.

- Network / Transport Layer

- POWERLINK compliant UDP/IP format

UDP/IP format

In order to enable the transmission of POWERLINK frames encapsulated in UDP/IP frames, the payload portion of the UDP/IP frame shall be leaded by a slightly modified POWERLINK frame header. [2, page 117, chapter 5.2]

	Bit Offset entry defined			entry defined by

Object dictionary.

The object dictionary.

Object dictionariy structures and their entries are common to all devices. An object dictionary entry is defined by:

- Index
- Object type
- Name
- Data type
- Catagory

Further more, for static data types following on next page...

Object dictionary.

The object dictionary.

 Access (rw, wo, ro, const, cond-¿variable access controlled by device)

- Value Range
- Default Value
- PDO Mapping (Process Data Object)
- Category
- Data type

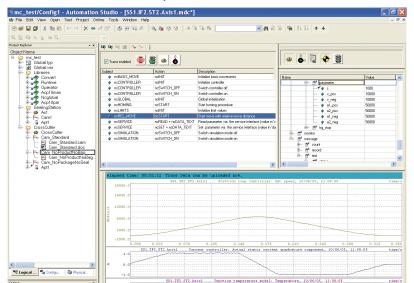

- Object dictionary.

Sub indexing and complex object types.

Complex object types (ARRAY, RECORD) objects are composed of up to 256 data items. Each data item may be addressed by an UNSIGNED8 type sub-index.

- Object dictionary.

Automation Studio example.

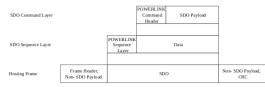

- Access to device via service data (SDO).

SDO layer model.

To access the entries of the object dictionary of a device via Ethernet POWERLINK a set of command services is specified. SDO communication attends to the client / server model.[2, page 131, chapter 6.3.2]

Ethernet POWERLINK provides three SDO transfer methods:

SDO transfer via UDP/IP frames in asynchronous phase

Hosting Frame non SDO payload only available at SDO embedded in PDO

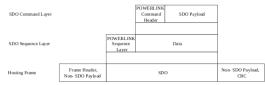

- Access to device via service data (SDO).

SDO layer model.

To access the entries of the object dictionary of a device via Ethernet POWERLINK a set of command services is specified. SDO communication attends to the client / server model.[2, page 131, chapter 6.3.2]

Ethernet POWERLINK provides three SDO transfer methods:

- SDO transfer via UDP/IP frames in asynchronous phase
- SDO transfer via POWERLINK ASnd frames in asynchronous phase

Hosting Frame non SDO payload only available at SDO embedded in PDO

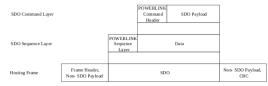

- Access to device via service data (SDO).

SDO layer model.

To access the entries of the object dictionary of a device via Ethernet POWERLINK a set of command services is specified. SDO communication attends to the client / server model.[2, page 131, chapter 6.3.2]

Ethernet POWERLINK provides three SDO transfer methods:

- SDO transfer via UDP/IP frames in asynchronous phase
- SDO transfer via POWERLINK ASnd frames in asynchronous phase
- SDO embedded in PDO in isochronous phas

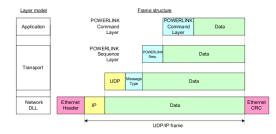

Hosting Frame non SDO payload only available at SDO embedded in PDO

- Access to device via service data (SDO).

SDO via UDP/IP.

The parameter transfer is based on a UDP/IP frame, allowing data transfer via a standard IP-router. Because UDP does not support a reliable connection oriented data transfer, this task must be supported by the sequence and command services.[2, page 131, chapter 6.3.2]

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ = 臣 = のへで

- Access to device via service data (SDO).

Asynchronous SDO Sequence Layer.

The POWERLINK Sequence Layer provides the service of a reliable bidirectional connection that guarantees that no messages are lost or duplicated and that all messages arrive in the correct order. Fragmentation is handled by the SDO Command Layer (6.3.2.4). The POWERLINK Sequence Layer Header for asynchronous transfer shall consist of 2 bytes. There shall be a sequence number for each sent frame, and an acknowledgement for the sequence number of the opposite node, as well a connection state and a connection acknowledge.[2, page 134, chapter 6.3.3]

- Access to device via service data (SDO).

Asynchronous SDO Command Layer. I

Tasks of the POWERLINK Command Layer:

- Addressing of the parameters, e.g. via index/sub-index or via name
- Provide additional services.
- Distinguish between expedited and segmented transfer.

The POWERLINK Command Layer is embedded in the POWERLINK Sequence Layer. If a large block is to be transferred the POWERLINK Command Layer has to decide whether the transfer can be completed in one frame (expedited transfer) or if it must be segmented in several frames (segmented transfer). Further it has to know whether an Upload or a Download should be initiated. For all transfer types it is the client that takes the initiative for a transfer. The owner of the accessed object dictionary is the server of the Service Data Object

- Access to device via service data (SDO).

Asynchronous SDO Command Layer. II

(SDO). Either the client or the server can take the initiative to abort the transfer of a SDO. All commands are confirmed. The remote result parameter indicates the success of the request. In case of a failure, an Abort Transfer Request must be executed. [2, page 140, chapter 6.3.2]

- Access to device via service data (SDO).

POWERLINK Command Layer Protocol.

The POWERLINK Command Layer is structured in the following way:

Byte	Bit Offset									
Offset ¹⁶	7	6	5	4	3	2	1	1	0	
0	reserved									Fixed part
1	Transaction ID									
2	Res- Abort Segmentation reserved									
	ponse									
3	Command ID									
45	Segment Size									
67	reserved									
811	Data Size (only if Segmentation = Initiate)									Variable part
(8 + 4*d)	Command ID specific header								Command ID specific	
k-1										part
k 1465	Optional Payload Data									

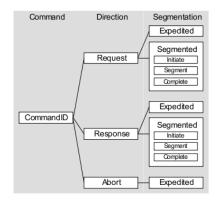

```
k = Length of Command ID specific header; k < 1465
d: if seg = Initiate d = 1
else d = 0
```

For embedding of SDO in cyclic data (PollRequest and PollResponse) the first byte within POWERLINK Command Layer is reserved for Embedded Sequence Layer.

- Access to device via service data (SDO).

POWERLINK Command Layer .

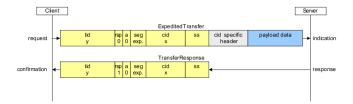

The structure of the information in the POWERLINK Command Layer Header.

- Access to device via service data (SDO).

Download Protocol (Expedited download).

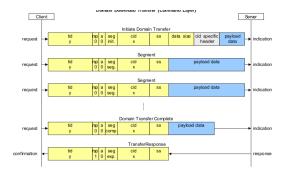

The download service is used by the SDO client to download data to the server (owner of the object dictionary). In an expedited download, the data identified by the cid specific header is transferred to the server.

- Access to device via service data (SDO).

Download Protocol (Domain download).

In a segmented transfer SDOs are downloaded as a sequence of zero or more Download SDO Segment services preceded by an Initiate SDO Download service and followed by a Transfer Complete frame.

▲□▶▲□▶★□▶★□▶ = つく⊙

Access to device via service data (SDO).

Upload protocol.

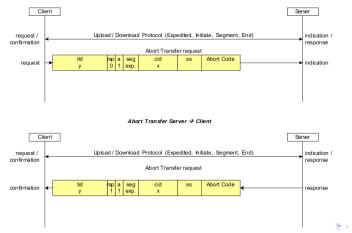

The Upload service is used by the SDO client to upload data from the server. It works analogous to the download protocol.
